

Data Mining Final Project

April 10, 2026

Deliverable

The following files should be submitted via teams.

- Your source codes with github link
- Jupyter Notebook format
- Project report prepared in IEEE Conference format with literature review

Be prepared to present your work at due date.

Specifications

Overview

Journal article is the one of the most respected outcome of a research. Often for the highest impact, the challenge for the researchers is to find the best fit journal for the article. With this project,

1. You will implement a journal finder software tailored to computer science subject areas.
2. Generate cluster of topics for subject areas

Material

We provided a list of 7711 articles from 175 Computer Science Journals.

You will be given the material for download

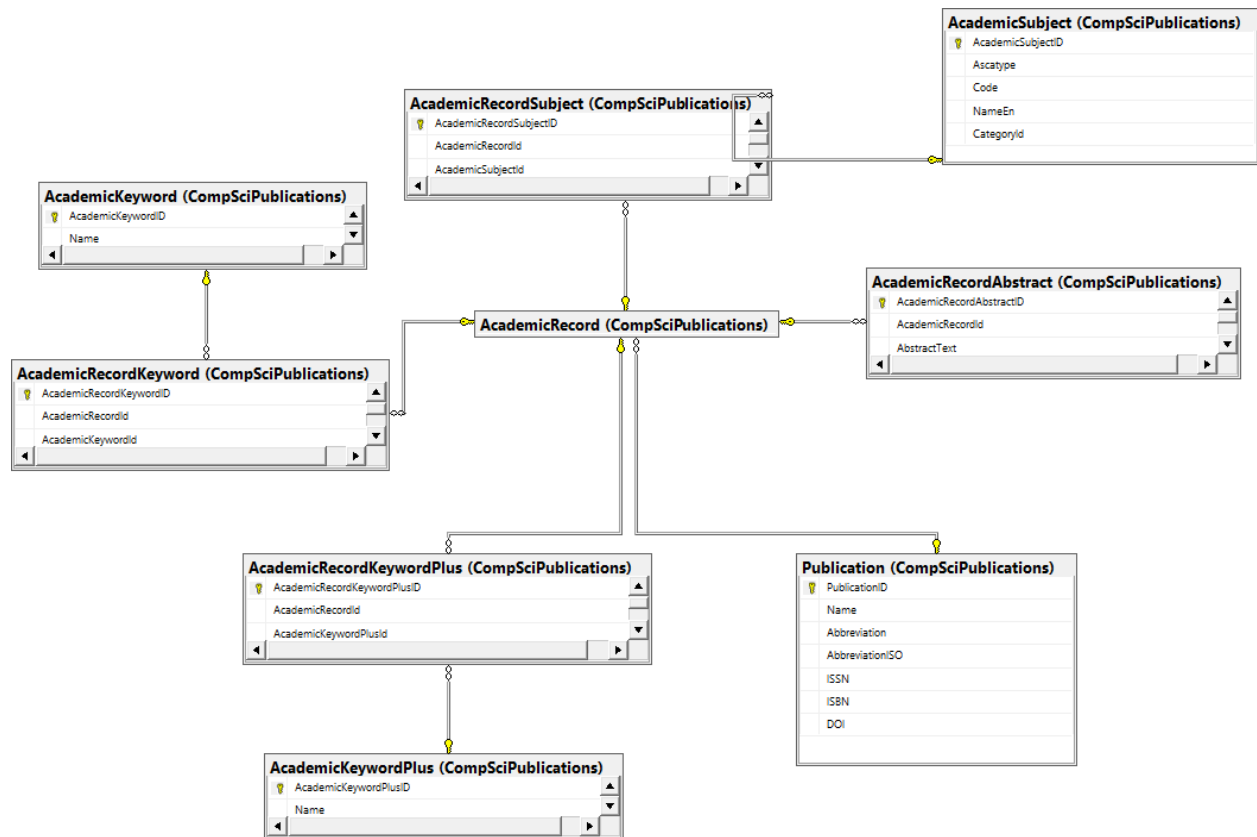

Figure 1: Database ER Diagram

In database, entities you may use:

AcademicRecord: Published article

AcademicRecordAbstract: Article's abstract

Publication: Journal of the article

AcademicRecordKeyword: Keywords given by the *author*.

AcademicRecordSubject: Article topics assigned by the *Web of Science*.

AcademicRecordKeywordPlus: Article keywords assigned by the *Web of Science*.

Method

You are free to use any data mining methodology and any entity/attributes of the database. However, at the end of your project, when author enters article's **abstract**, program must list the top 5 most relevant journals for the article.
